bbuilder ⇄ Polsia — closing the loop

This document explains how bbuilder's AI agent **Mya** now understands Polsia and how a generated $10K/mo idea travels from bbuilder into a Polsia company.

What Polsia is (as understood by Mya)

Polsia is an "AI that runs your company while you sleep" platform. A founder creates a company at `polsia.com/new` (from scratch or from an existing business) and a set of autonomous agents runs it continuously:

Agent	What it does	Cadence (OSS reference)
`orchestrator`	Plans and dispatches work to the other agents	continuous
`business_planning`	Roadmap, positioning, priorities	daily
`competitor_research`	Tracks competitors & market shifts	daily
`code_generation`	Ships product code (Claude Code CLI)	on demand
`deployment`	Deploys the product	on demand
`social_media`	Posts/replies on X/Twitter	~2h
`email_outreach`	Cold email campaigns	~3h
`customer_support`	Replies to inbound customer email	~3h
`ads_management`	Runs Google/Meta ads	~6h
`finance`	Stripe revenue, costs, KPIs	~6h

A Polsia company is described by a `CompanyConfig` record: `name, mission, vision, description, target_market, value_prop, pricing_model{plans[]}, goals, kpis, website_url, github_repo, product_type, industry`.

Public positioning, pricing and traction figures were derived from polsia.com, the open-source Polsia repos and public coverage at the time of writing and may drift. The knowledge lives in one place: `supabase/functions/_shared/polsia.ts` (`POLSIA_AGENTS`,

`POLSIA_INTEGRATIONS`, `POLSIA_COMPANY_CONFIG_FIELDS`, `POLSIA_FIT_RULES`, `POLSIA_ANTI_PATTERNS`). Update that file when Polsia changes.

The loop

```
Dashboard  ──"Who will run it?" → Polsia-ready──►  /chat/:id?gener-
ate=true&platform=polsia
    │
    ▼
Mya (edge fn `chat`, type=generate_ideas, platform="polsia")
    • canonical business-plan schema (unchanged, so saving/parsing still works)
    • + "## 🏢 Polsia Agent Plan"   — which Polsia agent owns each workstream
    • + "## 🧾 Polsia Company Brief" — CompanyConfig-shaped bullets + onboarding text
    │
    ▼
Handoff
    • Mya tool `export_polsia_company_brief` → CopilotActionCard with fit score,
      "Download JSON", "Copy onboarding text", "Open polsia.com/new"
    • Saved idea → BusinessIdeaDialog "Send to Polsia (autonomous agents)"
      (and "Polsia Company Brief (JSON)" in the download menu)
    │
    ▼
polsia.com/new  →  paste onboarding text / use the JSON to fill CompanyConfig
```

1. Polsia-ready generation mode

- `Dashboard.tsx` – the industry dialog gained a **Who will run it?** toggle: You + n8n (default, unchanged behaviour) or Polsia-ready. Choosing Polsia-ready adds `&platform=polsia` to the chat URL.
- `Chat.tsx` – reads `platform` from the query string, appends a short "make it Polsia-ready" sentence to the visible user message and passes `platform` to `streamChat`.
- `src/lib/ai.ts` – `StreamChatOptions.platform?: "standalone" | "polsia"` is sent in the request body.
- `supabase/functions/chat/index.ts`
- `ChatRequestSchema` accepts `platform`.
- When `platform === "polsia"` the `generate_ideas` prompt is `GENERATE_IDEAS_PROMPT + POLSIA_IDEA_ADDENDUM`. The addendum instructs Mya to only propose ideas that Polsia agents can run end-to-end (digital, self-serve Stripe monetisation, X/email/ads acquisition, async support, daily-trackable KPIs) and to avoid anti-patterns (physical fulfilment, in-person delivery, regulated verticals, human sales calls, agency hours).
- The two new sections are appended **after** the canonical schema so the regex parser in `Chat.tsx` (`parseBusinessIdea`) and `_shared/parseBusinessPlanMarkdown.ts` keep working.

2. Mya knows Polsia in every conversation

`SYSTEM_PROMPT` now includes a **POLSIA HANDOFF SUPER-SKILL** section built from `buildPolsiaKnowledgeBlock()` — agents, integrations, config fields, fit rules and anti-patterns — so Mya can answer "would this run on Polsia?", re-shape an existing idea, or export a brief on request.

3. `export_polsia_company_brief` tool (server)

Tool #23 in the `chat` edge function. It finds the latest business plan in the conversation (`findLatestPlanInMessages`), runs `buildPolsiaCompanyBrief()` and returns:

```
{
  "client_action": "download_polsia_brief",
  "filename": "<slug>.polsia.json",
  "brief": { "...CompanyConfig fields...", "agent_plan": {}, "onboarding_prompt": "",
"fit": { "score": 0, "signals": [], "warnings": [] } },
  "polsia_new_url": "https://polsia.com/new",
  "next_steps": ["..."]
}
```

`buildPolsiaCompanyBrief` is deterministic (no extra LLM call): it prefers the explicit "🧾 Polsia Company Brief" section when present and otherwise derives fields from the canonical sections. `assessPolsiaFit` gives a 0–100 heuristic score with positive signals and warnings.

4. Client-side handoff (`src/lib/polsiaHandoff.ts`)

Browser twin of the server helper so **already-saved ideas** (rows in `business_ideas`) can be exported without another round-trip:

- `buildPolsiaBriefFromIdea(savedIdea)` → `PolsiaCompanyBrief`
- `downloadPolsiaBrief` , `copyPolsiaOnboardingPrompt` , `fitLabel`
- `assessPolsiaFit` , `extractPricingPlans` , `inferProductType`

Used by `CopilotActionCard.tsx` (renders the tool result) and `BusinessIdeaDialog.tsx` (Send to Polsia button + JSON download item).

Tests: `src/lib/polsiaHandoff.test.ts` (vitest).

Files touched

File	Change
`supabase/functions/_shared/polsia.ts`	**new** – Polsia knowledge, prompt addendum, brief builder, fit scoring
`supabase/functions/chat/index.ts`	`platform` in schema, Polsia super-skill in system prompt, `export_polsia_company_brief` tool + executor, Polsia addendum in `generate_ideas`
`src/lib/polsiaHandoff.ts`	**new** – browser brief builder / download / copy helpers
`src/lib/polsiaHandoff.test.ts`	**new** – unit tests
`src/lib/ai.ts`	`platform` option forwarded to the edge function
`src/pages/Dashboard.tsx`	"Who will run it?" toggle, `&platform=polsia`
`src/pages/Chat.tsx`	reads `platform`, passes to `streamChat`
`src/components/Chat/CopilotActionCard.tsx`	renders the Polsia brief card
`src/components/BusinessIdeaDialog.tsx`	Send to Polsia button, JSON download item
`docs/POLSIA_INTEGRATION.md`	this document

Deploying

- Frontend changes ship with the normal Lovable/Vite build.
- The `chat` edge function must be **redeployed** (Lovable does this automatically on publish; otherwise `supabase functions deploy chat`). No database migration is required — no schema changes were made.

Known limits / next steps

- Polsia has no public API for creating companies, so the handoff is copy/paste + JSON download to `polsia.com/new`. If Polsia exposes an API, add a `POST` in `export_polsia_company_brief` and a "Create on Polsia" button.
- The fit score is a keyword heuristic, not a guarantee the business will work on Polsia.
- Polsia facts in `polsia.ts` are a snapshot; review them periodically.
